

Identify the problem:

We have a new Gym built in San Jose State University. However, it is not easy for students to find a group for group activities such as badminton, basketball or others. These sports require a pre-schedule between students. It is extremely hard for a single student to find another party to play with without a good communicate app.

Design Requirements and Goals:

Create an app that can allow student to post their schedules, find another part to do sports with manage their going events and make new friends through the app.

Ideate:

I choose to a close community app which requires to register through a valid SJSU id. Separate the core features into finding another people, read the post, manage your events and join an app hold activity.

Prototype:

I used a adobe xd to create a prototype. I have demonstrated to my classmate. I have also had them alpha and beta testing my prototype.
